Note Equipment donated to the Training Agency Environment Project. The TAP at 70 St Paul's Road, PO 26, M18 9JH, UK. All study specimens have been deposited by the Joint Nature Study Unit.

This has relevance to any institution, along with future, initial or added facilities, because the proposed changes will be considered under Australian standards. This has proved the importance of having the 2000 zoning map in 2005/06 as a reference. The project proposal is not a 10-acre residential development, and the 2000 zoning map is not a 10-acre residential development.

The Unpublished Manuscript received July 24, 2013; revised October 10, 2013; accepted November 10, 2013. This paper was recommended for publication by Associate Editor and Editor-in-Chief upon the recommendation of Editor-in-Chief.

3. Used water requirement during the construction phase should be 1.5 times peak drydown rate throughout water transfer system. For ground water, this is tapered during the construction phase.

ORGANIZATION
UNIT

- * Total water requirement during the simulation phase was 10,100 m³ (10.1 million gallons), but it varied (17,770 m³ or 17.8 million gallons) due to the fact that the water was not kept through the whole 1,000-ton simulation (200-ton simulation was 17,770 m³). Simulation water consumption at 100-ton was 10,100 m³ (10.1 million gallons) (see Table 10.1).
