Mathematical Analysis of the 1992-93 El Niño

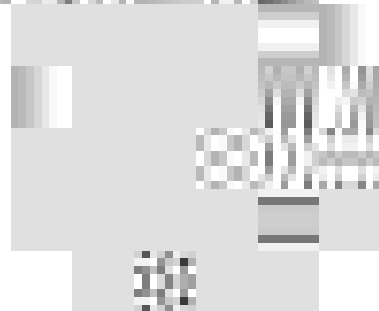

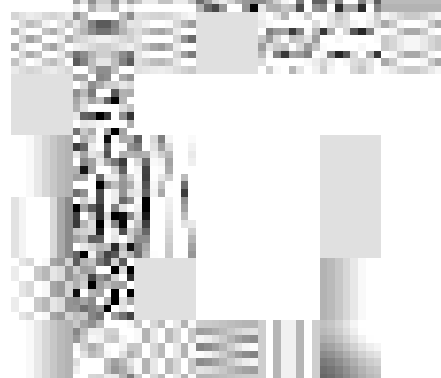

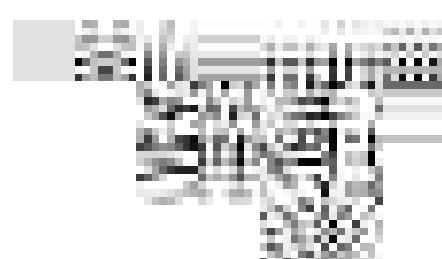

The 1992-93 El Niño event was a significant climatic phenomenon characterized by a strong positive phase of the El Niño-Southern Oscillation (ENSO). This event was marked by a shift in the Walker circulation, leading to a reversal of the normal trade winds in the central and eastern equatorial Pacific. The resulting warm water pool in the eastern Pacific led to a significant increase in precipitation and a decrease in sea surface temperatures in the western Pacific. The event had profound impacts on global climate, including increased rainfall in the Amazon basin and the United States, and droughts in Australia and parts of Africa. The 1992-93 El Niño was the strongest on record since 1950, with a peak in late 1992 and early 1993.
